

Our Approach

SynergERP adopts a unique 'use case' approach which focuses on business-critical process. They create the best design to take the business forward, rather than recreate a replica of the client's legacy system.

SynergERP Implementation Methodology (SIM)

Through our unique implementation methodology our projects get delivered on time, within budget and with the functionality that the client's business needs.

- **On time** - by utilising a parallel development processes and fully engaging the users early on through skills transfer and training.
- **Functionality you need** - our approach is start with the most important processes and ensure they are go-live ready. We focus on the areas where the client will derive the most value and create the best design to take the business forward.
- **Within budget** - by eliminating costly rework and non-value adding activities.

In SIM, teams break work into small increments that minimise the amount of up-front planning and design. The team works on all functions (planning, development, deployment, testing and so on) during these increments. At the end, they have an operational piece of the larger system ready to go.

Through this approach, the project team will stack all the separate increments to eventually create the whole system. In so doing, the customer has more flexibility to change and refine their requirements as they learn more about what their new system can do.

“

Great collaboration sums up the successful implementation of Sage X3 in MedSupply Dubai. The extended SynergERP team has helped us set a very good foundation for our future implementation projects in the Asia Pacific and Europe. ”

Sune Svenningsen *CEO, MedSupply International*
